Digital Literacy Project Report

Name : Somil Khandelwal

Reg No. : 25BCY10008

Program: B.Tech

Course : Digital Literacy

Course Code: CSE0001

Introduction

One step at a time, learning about Cyber Security and Digital Forensics in my first year took shape through real tasks. Instead of just theory, the CSE0001 Digital Literacy course pulled me into hands-on work as a Student Digital Ambassador. Each part of the experience unfolded across five clear sections, building skills around using tech wisely, staying safe online, and communicating well in digital spaces. My goal? To show what I've learned - yet also leave behind useful materials others can actually follow. While making visuals to spread awareness or setting up proper networking accounts, things started clicking. Even breaking down how scams like UPI fraud operate helped ground abstract ideas in reality. All of it together forms a record - not flashy, just honest - of how digital knowledge works when put into practice.

Task 1: Digital Literacy Awareness Infographic

Starting off with a blank screen, I picked Canva because it just works - no fuss, clean layout options, plenty to choose from. Colors that pop guided the eye across each section, meant to catch attention fast, made for quick reading by busy students. Instead of long paragraphs, short lines called out what matters: staying safe online, talking clearly through screens, spotting if sources are real or shaky. Squeezing big ideas like who sees your data or how apps decide what you see took trial after trial, cutting until only truth stayed. Hard part? Saying deep things simply, without dumbing down. That tight space became helpful, oddly satisfying even. Images carried weight where words stepped back, doing more by showing, leaving room to think instead of overload. What felt limiting at first turned useful, shaping how much to show, when to let silence speak louder than blocks of type.

Task 2: Student Digital Portfolio

From day one, profiles went live on GitHub, LinkedIn, and Kaggle - each shaping a different piece of my digital presence. Since coding sits at the core of security work, school assignments and personal experiments found their home on GitHub. Projects stay visible there, updated regularly, with every edit recorded step by step. Talking to folks already in tech? That's where LinkedIn stepped in. When reaching out felt right, that platform made connections possible. Talking about grades, classes, or certifications started chats without trying. Kaggle comes in next - working with numbers turns into something closer to cracking riddles than learning by heart. Practice problems and open data give a way to try classroom ideas the same week they're taught. Across the coming years, those bits fit under the surface while coursework moves forward. One place keeps track of scripts, another builds links, yet another handles stats - they belong together even when split up. From now on, I'll post updates right here on LinkedIn - logging insights as they happen, talking

with people who hire, figuring out where internships might fit. Out there on Kaggle, messy actual cases push my thinking further than school assignments ever do.

Task 3: Coding and Collaboration Platforms

Starting off with the coding part, I tackled the beginner Python tasks at HackerRank. Right after each try, the system checked my work on its own - super helpful for learning how to write correct code and think through problems step by step. On another note, teamwork came into play when I built a quiz about digital safety using Google Forms. Instead of just picking answers, some questions asked classmates to explain their thoughts on scams and strong passwords. Once responses started coming in, they flowed straight into a Google Sheet so everything stayed neat and sorted. Each day, practice on HackerRank shapes how I tackle coding problems faster, getting me ready for interview challenges. When working

with classmates, Google Forms and Sheets help gather responses, manage project details, then keep everyone in sync - even if we are miles apart.

Task 4: Professional Email and Etiquette Guide

That moment when hitting reply all backfires sticks in your mind. A student wanted to share a complaint with just one friend - about a grade they thought unfair - but clicked the wrong button instead. Out went their blunt opinion, straight to the whole class plus the teacher. Awkward silence followed, trust cracked, things got tense. Pausing first might've changed everything. Checking who gets the message matters more than most think. Writing only what you'd speak aloud keeps trouble at bay. Once sent, words live on whether you like it or not. Care shows up in small choices, especially online.

Task 5: Cybercrime Awareness Case Study and Prevention

One thing stood out when I looked into UPI scams for my project: trickery beats tech every time. Scammers don’t break systems - they twist minds. Pressure becomes their tool, pushing people to act fast and think later. A fake alert saying you’ll receive cash can make someone punch in their PIN without blinking. Even sharp university kids get caught - distraction opens the door. What clicked after digging through cases? My own reflexes need adjusting. Now, each request makes me stop. Ten seconds flat. Read everything. Then decide. Urgency won’t rush me again.

Conclusion

Putting together this Digital Literacy portfolio helped me connect what I've studied with real-world tasks. Not just clicking buttons - being a Digital Ambassador taught me that handling technology well means questioning information, staying respectful online, then spotting risks before they grow. Confidence came slowly: organizing my presence online, speaking clearly during virtual meetings, recognizing scams dressed up as normal messages. Through trial, error, attention, each step built something steady - a base for school demands, job paths ahead, whatever comes next in tech work.
